Abstract:

Jotić, B., Marković, M., Petrović, B., Fusijanović, I., Pavlović, D., Randelović, V.: The vascular flora of the Vučje hill near Pirot city (Eastern Serbia). Biologica Nyssana, 2 (2), December 2011: 91-106.

As a result of the floristic investigations of the Vučje hill carried out between 2008 and 2010, 534 plant taxa belonging to 277 genera and 67 plant families were recorded. Phytogeographical analysis showed that the species of eurasian area type are the most abundant ones. There are 10 endemic taxa in flora of investigated area. The hemicryptophytic character of flora with significant contribution of therophytes and geophytes, is established by analyzing the presence of plant life forms. 31 species are listed as protected or strictly protected in national legislature, while some of them are of international importance for conservation.

Key words: endemic, flora, Pirot city, Vučje hill

Introduction

The Vučje hill (1188 m) is situated in eastern Serbia, 8 km SE of Pirot city, above the Krupac village (**Fig. 1**). This is the part of Mt. Vidlič, westernmost part of the mountain system Stara planina. The hill is elongated in the southeastern-northwestern direction. In contrast to other regions of mountain system Stara planina, Mt. Vidlič are represented by unique geological structure and climate conditions. The geological structure of the most part of Mt. Vidlič is represented by limestone, while other Serbian parts of Stara planina are built of silicate (Vidanović, ed., 1960). The pedological substrate is consisted of reddish soil tiller and mountain soil. The climate of this area is transitional humid continental, between dry climate of Pirot region and wet climate on Mt. Stara planina

(Vidanović, ed., 1960). Although the flora of this part of Mt. Stara planina was investigated by Pančić (1884) and Adamović (1911), it has not been well known. The Vučje hill flora is not investigated up to now.

Materials and methods

The flora of Vučje hill were studied in the period between 2008 and 2010. Herbarium specimens are deposited at the Herbarium Moesiacum (HMN).

Determination of plant material was carried out using the keys from the regional flora reference (Josifović, ed. 1970-1977; Velčev, ed. 1982-1989). The nomenclature follows Med-Checklist (Greuter et al., 1984-1989) and Flora Europaea (Tutin et al., eds., 1964-1980).

For the area types classification Meusel et al. (1965, 1978), Meusel and Jäger (1992) and Stevanović (1992) were used.

Life forms were determined according to Mueller-Dombois and Ellenberg (1974) and Stevanović (1992a).

Results

As a result of the floristic investigations of Vučje hill in eastern Serbia, 534 plant taxa belonging to 277 genera and 67 families were recorded (**Tab. 1**).

Disscusion

Taxonomic analysis

Divisio Pteridophyta was represented by single class Polypodiopsida with only 7 species. Pinophyta was represented with single class Pinopsida and just one species. Divisio Magnoliophyta was represented by 526 species, from which 439 are classified as dicotyledons

(Magnoliopsida) and 87 as monocotyledons (Liliopsida).

In taxonomic spectrum of the flora of investigated area the most numerous in genera were Compositae (36), Gramineae (29), Labiateae (20), Criciferae (17) and Leguminosae (17).

Families with the most number of species were Compositae (63), Leguminosae (55), Gremineae (47) and Labiateae (36).

The analysis of the particular genera occurrence in flora of the Vučje hill has shown

domination of representatives of genera *Trifolium* (11), *Euphorbia* (10), *Lathyrus* (8), *Viola* (8), *Vicia* (7) *Sedum* (7), following by the genera *Centaurea*, *Veronica* and *Allium* with 6 species in each genus.

Phytogeographical analysys

For the phytogeographical analysis, all plant taxa were classified into 10 area types (Fig. 2) according to the classification by Stevanović (1992).

Eurasian area type (EAs) was the most dominant in the flora of the Vučje hill with 303 taxa (56.7%). The second one was Mediterranean-Submediterranean area type (Med) with 75 species (7.9%).

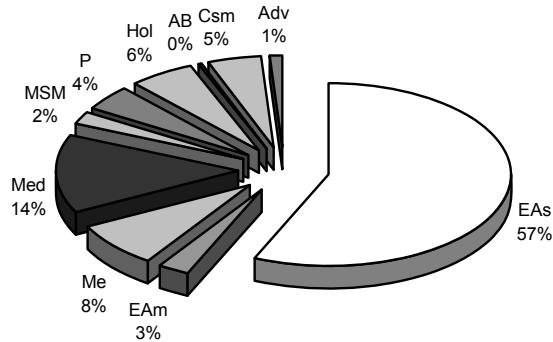

Figure 2. Area spectrum of the flora of Vučje hill:
Csm – Cosmopolitan, **Hol** – Holarctic, **AB** – Arcto-Alpian + Boreal, **Me** – Middle-European, **EAs** – Euroasian, **EAMt** – Euroasian Mountain, **P** – Pontic, **MSM** – Merridional-Submerridional, **Med** – Mediterranean-Submediterranean, **Adv** – Adventitious

There were 10 Balkan endemic taxa in the flora of the Vučje hill. These represents 3,48% of the total number of Balkan endemics in Serbian flora, which includes 287 taxa in rank of species and subspecies (Stevanović et al., 1999). Small number of endemic floral elements are expected due to uniformity of habitats in the wider area of Vučje.

The recorded Balkan endemics are: *Acanthus balcanicus*, *Acer hyrcanum* subsp. *intermedium*, *Bupleurum flavidans*, *Eryngium palmatum*, *Hypericum rumeliacum*, *Thymus praecox* subsp. *jankae*, *Pulsatilla montana* subsp. *bulgarica*, *Linaria rubrioides* subsp. *nissana*, *Viola tricolor* subsp. *macedonica* and *Sesleria latifolia*.

Biological spectrum

The analysis of plant life forms (Fig. 3) showed that flora of investigated area was of hemicryptophyta type, as well as the flora of Serbia

(Diklić, 1984) and Balkan peninsula (Turill, 1929). The hemicryptophytes were represented with 45%; therophytes followed with 26,9% and geophytes with 11,1%. The climatic characteristics of this area caused the high percentage of hemicryptophyta.

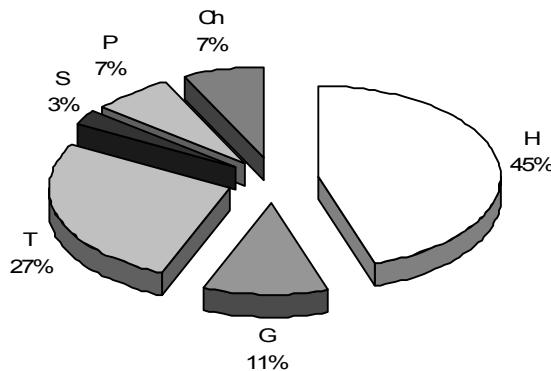

Figure 3. Biological spectrum of the flora of Vučje hill: **P** – Phanerophyta, **Ch** – Chamaephyta, **H** – Hemicryptophyta, **G** – Geophyta, **T** – Terophyta, **S** – Scandetophyta

Threatened status

Even the flora of the Vučje hill is diverse and rich, consisting of 526 plant taxa, 63 representatives are considered to be threatened in flora of Serbia.

In the flora of the Vučje hill were registered 9 strictly protected species: *Acer hyrcanum* subsp. *intermedium*, *Vinca herbacea*, *Sideritis montana*, *Adonis vernalis*, *Pulsatilla montana* subsp. *bulgarica*, *Gagea minima*, *Ophrys apifera*, *Orchis pallens* and *Stipa pulcherrima* (Anonimous, 2010).

Also, in the flora of the Vučje hill were registered 22 protected species, such as: *Achillea clypeolata*, *Corylus colurna*, *Allium albidum*, *Lilium martagon*, *Listera ovata*, *Prunus tenella*, *Ajuga laxmannii*, *Salvia austriaca* and other (Anonimous, 2010).

In the flora of the study area registered 33 species, that are covered by regulation on collecting, use and sale, such as: *Hedera helix*, *Asarum europaeum*, *Achillea millefolium*, *Pulmonaria officinalis*, *Primula veris*, *Rosa canina*, *Teucrium chamaedrys* and other (Anonimous, 2010a).
