Abstract. The aim of this paper is to describe the elements in rings with involution which are EP. Especially, contact is established between EP elements and the solutions of certain equations. In addition, we reduce the preliminary requirements met in some existing results.

1. Introduction

Throughout this paper, $R$ will denote a unital ring with involution, i.e., a ring $R$ with a map $a \mapsto a^\dagger$ satisfying $(a^\dagger)^\dagger = a$, $(ab)^\dagger = b^\dagger a^\dagger$ and $(a + b)^\dagger = a^\dagger + b^\dagger$, for all $a, b \in R$. The notion of Moore-Penrose inverse (or MP-inverse) has been investigated by many authors (see, for example, [6, 8, 9]). We say that $b = a^\#$ is the Moore-Penrose inverse (or MP-inverse) of $a$, if the following conditions hold: $aba = a$, $bab = b$, $(ab)^\dagger = ab$, and $(ba)^\dagger = ba$. There is at most one $b$ such that the above conditions hold. We write $R^\#$ for the set of all MP-inverses of $R$. $a$ is said to be group invertible if there is $a^\# \in R$ such that $a a^\# a = a$, $a^\# a a^\# = a^\#$; $a a^\# = a^\# a$. $a^\#$ is called a group inverse of $a$ and it is uniquely determined by these equations. Denote by $R^\#(\#)$ the set of all group invertible elements of $R$.

An element $a \in R$ is said to be an EP element if $a \in R^\dagger \cap R^\#$ and $a^\# = a^\dagger$ [3]. The set of all EP elements of $R$ will be denoted by $R^\text{EP}$. Mošić et al. in [12, Theorem 2.1] gave several equivalent conditions under which an element in $R$ is an EP element. Patrício and Puystjens in [14, Proposition 2] proved that for an element $a \in R$, $a$ is EP if and only if $a \in R^\dagger$ (or $a \in R^\#$) and $aK = a^\dagger R$ if and only if $a \in R^\#$ and $aa^\# = a^\# a$. It is known by [10, Theorem 7.3] that $a \in R$ is EP if and only if $a$ is group invertible and $aa^\#$ is symmetric. More results on EP elements can also be found in [2, 4, 5, 7, 11, 15].

This paper considers the characterization of EP elements, from the perspective of the solutions of equations. Let $a \in R^\dagger \cap R^\#$ and $\chi_a = \{a, a^\dagger, a^\#, (a^\#)^\dagger, (a^\dagger)^\dagger\}$. It will be proved that the equation $axa^\dagger = xa^\dagger a$ has at least one solution in $\chi_a$ if and only if $a \in R^\text{EP}$. In Corollary 2.6, we reduce the condition $aa^\dagger = a^2(a^\dagger)^2$ in [1, Proposition 2.3]. In Theorem 2.10, we change [16, Theorem 2.2] by using the condition $x = ax^2$ in $J(R)^{\text{comm}}(a)$ to replace the requirement $x = ax^2$, where $J(R)$ is the Jacobson radical of $R$. As we know, $aa^\dagger = a^2(a^\dagger)^2$ and $a^\# a = (a^\dagger)^2 a^2$ are equivalent [1], and so do $aa^\dagger = (a^\dagger)^2 a^2$ and $a^\# a = a^2(a^\dagger)^2$ which is proved in Proposition 2.11. Finally, with the help of the results mentioned above, we show that even if the restrictive conditions $(a^\dagger)^2 a^\# = a^\# (a^\dagger)^2$ in [12, Conjecture 1] and $a^\# R^\dagger$ in [1, Corollary 2.5] are reduced, the relevant conclusions are still established.

2. EP elements and the solutions of equation

In this section, we let $R$ be a ring with involution $\ast$. For any $a \in R$, denote

$$\text{comm}(a) = \{x \in R | xa = ax\}, \text{I}(a) = \{z \in R | za = 0\}, \text{and}$$

$$\text{comm}^2(a) = \{y \in R | xy = yx, \text{for all } x \in \text{comm}(a)\}.$$

Lemma 2.1. Let $a, b \in R^\#$ and $x \in R$. Then $ax = xb$ if and only if $a^\#x = xb^\#$.

Proof. $\Rightarrow$ It follows from $ax = xb$ that

$$a^\#x = (a^\#)^2ax = (a^\#)^2xb = (a^\#)^2xb^\# = (a^\#)^2axb^\# = a^\#xb^\#.$$

On the other hand, it is obvious that

$$xb^\# = xb(b^\#)^2 = ax(b^\#)^2 = a^\#a^2x(b^\#)^2 = a^\#axb(b^\#)^2 = a^\#axb^\# = a^\#xb^\#.$$

Hence, $a^\#x = xb^\#$.

$\Leftarrow$ Since $a^\#x = xb^\#$, we get

$$ax = a^2a^\#x = a^2xb^\# = a^2x(b^\#)^2 = a^2a^\#xb^\# = a^\#xb = axb^\#.$$ 

What is left is to show that $xb = axb^\#b$. In fact,

$$xb = x(b^\#)^2 = a^\#xb^\# = a(a^\#)^2xb^\# = a^\#xb^\#b^\# = a^\#xb = axb^\#.$$

Hence $ax = xb$. $\Box$

Especially, choosing $a = b$ in Lemma 2.1, we have the following corollary.

Corollary 2.2. [13, P733] If $a \in R^\#$, then $a^\# \in \text{comm}^2(a)$ and $a \in \text{comm}^2(a^\#)$.

Let $R$ be a ring and write $ZE(R) = \{x \in R | xe = ex, \text{for all } e \in E(R)\}$, where $E(R)$ is the set of all idempotents in $R$. Then $ZE(R)$ is a subring of $R$.

Theorem 2.3. Let $R$ be a ring and $a \in R^\#$. If $a \in ZE(R)$, then $a \in ZE(R)^\#$.

Proof. Note that $a \in R^\#$. Then $a^\#$ exists and $a^\# \in R$. For each $e \in E(R)$, we have $e \in \text{comm}(a)$ because $a \in ZE(R)$. By Corollary 2.2, $ca^\# = a^\#c$. Hence $a^\# \in ZE(R)$, it follows that $a \in ZE(R)^\#$. $\Box$

Lemma 2.4. Let $a \in R^\# \cap R^\perp$. Then $a \in R^{EP}$ if and only if one of the following conditions holds:

1. $a^\#R \subseteq aR$;
2. $Ra \subseteq Ra^\#$.

Proof. It is well-known that $a^\#R = a^\#R$ and $Ra^\# = Ra^\#$. Consequently, Lemma 2.4 follows by [1, Theorem 3.6]. $\Box$

Let $a \in R^\# \cap R^\perp$. Write $\chi_a = \{a, a^\#, a^\perp, a^\#, (a^\#)^*, (a^\perp)^*\}$. Now, we consider the relations between EP elements and the solutions of the equation $axa^\perp = xa^\#a$ in $\chi_a$.

Theorem 2.5. Let $a \in R^\# \cap R^\perp$. If the equation $axa^\perp = xa^\#a$ has at least one solution in $\chi_a$, then $a \in R^{EP}$. 
Proof. (1) When \( x = a \), then \( a^2a^* = aa^*a = a \). It follows from [11, Theorem 2.1(xviii)] that \( a \) is an EP element.

(2) When \( x = a^* \), then \( aa^*a^2 = a^*a^a = a^*(a^*)^* = (a^2a^*). \) By applying involution on the above equation, we have \( a^2a^2 = (a^*)^aa^* \). According to the last equation, we have
\[
a^2R = a^*aR = a^*a^a^aR \subseteq a^*a^2R = (a^2)^*a^*R \subseteq (a^*R = aa^*(a^*)^R \subseteq aR. 
\]
It follows from Lemma 2.4 that \( a \) is an EP element.

(3) When \( x = a^2 \), then \( aa^*a^2 = a^*a^a^a \). That \( a \) is an EP element follows from [12, Theorem 2.1(xix)].

(4) When \( x = (a^*)^* \), then \( a(a^*)^*a^* = (a^*)^*a^a = (a^*a)^*a \). Applying involution on the equation, we get \( a^*a(a^*)^*a = (a)^*a^a^a \). This means that
\[
a^*R = a^*aR = a^*a^a^aR \subseteq a^*a^a^aR = (a^*)^*a^*R \subseteq (a^*R = aa^*(a^*)^R \subseteq aR. 
\]
Hence \( a \) is an EP element by Lemma 2.4.

(5) When \( x = (a)^* \), then \( a(a^*)^*a^* = (a)^*a^a = (a^*a)^* = (a)^* \). It follows that \( a^* = (a)^*a^a \). This gives \( a^*R \subseteq (a^*)^R \subseteq aR. \) Therefore, \( a \) is an EP element by Lemma 2.4.

(6) When \( x = a^2 \), then \( aa^*a^2 = a^*a^a^a \). We deduce that
\[
a^*a^2 = (aa^*)a^a = (a^2)^*a^a = a^a(a^2)^*a = (a^2)^*a^a = (a^2)^*a^a.
\]
Applying involution on the last equation, \( (a^2)^*a^a = (a^2)^*(a^2)^*a = (a^2)^*a^a \).

Post-multiplying by \( a^2 \), we get \( a^2a^2 = (a^2)^*a^a = (a^2)^*a^a = (a^2)^*a^a \). The other hand, \( a^2a = (a^2)^*a^a \). We assert that \( a^2a = (a^2)^*a^a = (a^2)^*a^a \). Therefore, \( Ra = Ra^a = R(a^2)^*a^a \subseteq Ra^a \). By Lemma 2.4, we obtain that \( a \) is an EP element.

Let \( a \in \mathcal{R} \cap \mathcal{R}^\perp \). Then \( a^2a^*a^2 = a^2a^*a^2 \) if and only if \( aa^*a^2 = a^2a^*a^2 \), by Corollary 2.2. Thus we have the following corollary which illustrates that the condition \( a^2 = a^2(a^2)^* \) in [1, Proposition 2.3] is superfluous.

**Corollary 2.6.** Let \( a \in \mathcal{R} \cap \mathcal{R}^\perp \). Then \( a \in \mathcal{R}^\perp \) if and only if \( a^2a^*a^2 = a^2a^*a^2 \).

Since \( a \) is an EP element, we get \( a^* \in \mathcal{R}^\perp \). Take \( b = a^* \). If \( axa = xa^*a \) for any \( x \in \mathcal{R} \), then \( bb^*y = b^*yb \), where \( y = x^* \). By Theorem 2.5, we have the following theorem.

**Theorem 2.7.** Let \( a \in \mathcal{R} \cap \mathcal{R}^\perp \). If the equation \( aa^*x = axa \) has at least one solution in \( \chi_a \), then \( a \in \mathcal{R}^\perp \).

Next, we give an example in which \( a \in \mathcal{R}^\perp \) but \( a^* \) and \( (a^*)^* \) are not the solutions of equation \( axa = xa^*a \).

**Example 2.8.** Let ring \( S = M_2(\mathcal{R}) \) of which the involution \( * \) is the transposition of a matrix in \( S \). Write \( A = \begin{pmatrix} 1 & 0 \\ 1 & 1 \end{pmatrix} \).

We have
\[
A^* = \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix} \quad \text{and} \quad A^{-1} = \begin{pmatrix} 1 & 0 \\ -1 & 1 \end{pmatrix}.
\]
This implies that \( A^T = A^* = A^{-1} \). However,
\[
\begin{pmatrix} 1 & 0 \\ 1 & 1 \end{pmatrix} \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 1 & 1 \end{pmatrix} = \begin{pmatrix} 1 & 1 \\ -1 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ -1 & 1 \end{pmatrix} = \begin{pmatrix} 0 & 1 \\ -1 & 2 \end{pmatrix},
\]
and
\[
\begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ -1 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix}.
\]
That is, $AA^*A^\dagger \neq A^*A^\dagger A$. Similarly, we have

$$A(A^*A^\dagger = \begin{pmatrix} 2 & -1 \\ 1 & 0 \end{pmatrix} # (A^*A^\dagger A.$$ 

The last inequation now leads to $A(A^*A^\dagger A^\dagger \neq (A^*A^\dagger A.$

Let $\chi'_a = \{b \in \chi_a : aba^* = ba^*a\}$. Denote by $|\chi'_a|$ the number of all elements in $\chi'_a$. By Example 2.8, we know that $a \in R^{EP}$ cannot imply $|\chi'_a| = |\chi_a|$. In the following corollary, we show that $|a, a^\dagger, a^\#| \subseteq \chi'_a$.

**Corollary 2.9.** Let $a \in R^\# \cap R^\dagger$. Then $a \in R^{EP}$ if and only if $|\chi'_a| \geq 3$.

**Proof.** From Theorem 2.5, the sufficiency is obvious. Conversely, if $a$ is an EP element, then $a^\dagger = a^\#$. It follows that $a^2a^\dagger = a^2a^\# = a = aa^\dagger a = aa^\dagger a^\# = a^\dagger a^\#a = a^\dagger a^\#a = a^\dagger a^\#a = a^\dagger a^\#a$. Thus $|a, a^\dagger, a^\#| \subseteq \chi'_a$. That is, $|\chi'_a| \geq 3$. 

As usual, we let $J(R)$ be the Jacobson radical of $R$ and $U(R)$ be the set of all invertible elements of $R$. In [16, Theorem 2.2], it is shown that $a \in R^{EP}$ if and only if the system of equations $a = xa^2, (xa)^* = xa$, and $x = axa^2$ has at least one solution in $R$. Motivated by the result, we have the following theorem.

**Theorem 2.10.** $a \in R^{EP}$ if and only if there exists $x \in R$ such that

$$a = xa^2, (xa)^* = xa, \text{ and } x - axa^2 \in J(R) \cap \text{comm}(a).$$

**Proof.** If $a$ is an EP element, then $a^\dagger = a^\#$. It is easy to show that $a^\dagger$ satisfies the above three relations. Conversely, writing $t = x - axa^2$, we deduce that

$$a = xa^2 = (ax^2 + t)a^2 = axa^2 + ta^2 = axa + ta^2.$$ 

That is, $a - ta^2 = axa$. It follows from $t \in J(R) \cap \text{comm}(a)$ that $a - a^2t = axa$. Thus, $a(1 - at) = axa$. Note that $1 - at \in U(R) \cap \text{comm}(a)$ for $at \in J(R)$. So $(1 - at)^{-1}a = a(1 - at)^{-1}$. The last equation but one, post-multiplied by $(1 - at)^{-1}$, we get

$$a = ax(1 - at)^{-1}a = axa^2 + t(1 - at)^{-1}a = axa^2(1 - at)^{-1}a + at(1 - at)^{-1}a.$$ 

This gives $a(1 - t(1 - at)^{-1}a) = a^2x^2(1 - at)^{-1}a$. Since $t(1 - at)^{-1}a \in J(R)$, we get $1 - t(1 - at)^{-1}a \in U(R)$. It follows immediately that

$$a = a^2x^2(1 - at)^{-1}a(1 - t(1 - at)^{-1}a)^{-1} \in a^2R.$$ 

On the other hand, $a = xa^2 \in Ra^2$. Thus $a \in R^\#$. It is easy to verify that

$$aa^\# = xa^2a^\# = xa = (xa)^* = (xa^\dagger a)^* = (xa^2a^\#)^* = (aa^\#)^*.$$ 

It yields that $a^\dagger = a^\#$. This completes the proof. 

Motivated by [12, Conjecture 1] and [1, Proposition 2.2, Corollary 2.5], we have the following results about EP elements.

**Proposition 2.11.** Let $a \in R^\# \cap R^\dagger$. Then the following conditions are equivalent:

1. $a \in R^{EP}$;
2. $aa^\dagger = (a^\dagger)^2a^2$;
3. $a^\dagger a = a^2(a^\dagger)^2$. 

Proof. If $a$ is an EP element, then it implies that $aa^* = (a^*)^2a^2$. Suppose the condition (2) hold. Then we have $aa^* = (a^*)^2a^2$. Post-multiplying by $a^*a^*$, we claim that
\[a^*a^* = a(a^*)^2a = aa^*a^*a^* = (a^*)^2a^*a^* = (a^*)^2aa^* = (a^*)^2.\]
Indeed, pre-multiplying by $a$, we get $a^*a^*a = a(a^*)^2a = (a^*)^2a^*a^* = (a^*)^2aa^* = (a^*)^2$. Finally, post-multiplying by $a$, we obtain $a^*a = a^*a^*a = a(a^*)^2a = (a^*)^2a^*a^* = (a^*)^2a^*a = (a^*)^2a^* = a^*$. This means that $a$ is an EP element. We thus get $a^2 = a^*a^* = a^*a = a^*$.

The implication (3) $\Rightarrow$ (1) is similar to (2) $\Rightarrow$ (3). \[\square\]

**Theorem 2.12.** Let $a \in \mathbb{R}^n \cap \mathbb{R}^k$ and $m \geq 2$ be a positive integer. Then the following conditions are equivalent:

1. $a \in R^{EP};$
2. $aa^* = (a^*)^ma^m,$ for $0 \leq k < m;$
3. $aa^* = (a^*)^ma^m,$ for $1 \leq k \leq m.$

Proof. If $a$ is an EP element, then $a^* = a^*.$ It is clear that the conditions (2) and (3) hold. Conversely, assume that $aa^* = (a^*)^ma^m,$ for $0 \leq k < m.$ Then $a = aa^*a = a(a^*)^ma^m,$ for $0 \leq k < m.$

Post-multiplying by $a^2$, we get $aa^* = a(a^*)^ma^m,$ for $1 \leq k \leq m.$ Hence, $a$ is an EP element.

Suppose that $aa^* = (a^*)^ma^m,$ for $1 \leq k \leq m.$ Then we have $aR = aa^*R = (a^*)^ma^mR \subseteq a^*R.$

It follows from Lemma 2.4 that $a$ is an EP element. \[\square\]

Particularly, taking $m = 2, k = 0, 1$ in (2) and $k = 1$ in (3), we have the following corollary.

**Corollary 2.13.** $a \in R^{EP}$ if and only if $a \in R^k \cap R^\ast$ and one of the following conditions holds:

1. $aa^* = (a^*)^2a;$
2. $aa^* = a^*a^2.$

**Corollary 2.14.** $a \in R^{EP}$ if and only if $a \in R^k \cap R^\ast$ and one of the following conditions holds:

1. $aa^* = a^*a^2a;$
2. $a^* = (a^*)^2a;$
3. $a^* = (a^*)^2;$
4. $a = a^*a^*a^*a^*,$ for $n \geq 1.$

Proof. If $a$ is an EP element, then the conditions (1)-(4) are clearly satisfied. Conversely, if the condition (1) hold, then $a(a^*)^2a = a^*a^2a^2.$ Pre-multiplying by $a$, we have $a^2(a^*)^2a = a(a^*)^2a = a^2a^2a.$ Then $a(a^*)^2a = (a^*)^2(a^*)^2a = a^*a^2a^2 = a^2a^2 = a^*.$

From Corollary 2.13, we see that $a$ is an EP element.

Assume that the condition (2) hold. Then we have $aa^* = a((a^*)^2a) = (a(a^*)^2a. It follows from Corollary 2.13 that $a$ is an EP element.

Suppose that $a^* = (a^*)^2.$ Then we get $a = aa^*a = a^2(a^*)^2a.$ Pre-multiplying by $a^2$, we obtain $a^2a = a^2a^2(a^*)^2a = a^*(a^*)^2a = a^2a^2 = a^*.$ It yields that $a$ is an EP element.

If the condition (4) hold, then we get $a^*a = a^2(a^*a)^2a = a^2a^2(a^*a)^2a = a^2a^2(a^*a)^2a = a^2a^2(a^*a)^2a = a^2a^2.$

It follows that $a$ is an EP element. \[\square\]
