

Diversity of aphids (Homoptera: Aphididae) in Southeastern Serbia

Original Article

Abstract:

Aphids represent one of the most significant pest species in agroecosystems. In this study we investigated aphid diversity in Southeastern Serbia. We recorded 132 species, mostly infesting host plants from the families Asteraceae and Rosaceae. The most diverse genus was *Aphis* Linnaeus with 34 species. Within this genus, the most frequently sampled species was *A. fabae* Scopoli. Genera *Uroleucon* Mordvilko, *Brachycaudus* van der Goot and *Dysaphis* Börner were also represented by a large number of species.

Key words:

aphids, Southeastern Serbia, species richness

Apstract:**Raznovrsnost biljnih vaši (Homoptera: Aphididae) u jugoistočnoj Srbiji**

Biljne vaši predstavljaju jednu od najznačajnijih grupa štetočina u agroekosistemima. U ovoj studiji istraživali smo raznovrsnost biljnih vaši u jugoistočnoj Srbiji. Zabeležili smo 132 vrste, koje uglavnom zaražavaju biljke domaćine iz porodice Asteraceae i Rosaceae. Najraznovrsniji rod je *Aphis* Linnaeus sa 34 vrste. U ovom rodu, najčešće uzorkovana vrsta je *A. fabae* Scopoli. Rodovi *Uroleucon* Mordvilko, *Brachycaudus* van der Goot i *Dysaphis* Börner takođe su predstavljeni velikim brojem vrsta.

Ključne reči:

biljne vaši, jugoistočna Srbija, bogatstvo vrsta

Introduction

Aphids (Homoptera: Aphididae) are one of the most economically important insect group in agriculture. They are significant plant pests, both in cultivated and self-seeding plants. Apart from causing direct damage by sucking plant juices, they also transmit many plant viruses, such as the bean yellow mosaic virus, bean common mosaic virus, cucumber mosaic virus (Gálvez & Morales, 1989). Aphids are distributed worldwide, but usually most common in temperate areas of the Northern hemisphere. Number of described species in world to this date is about 4700, of which about one third have been recorded from Europe (Coeur d'acier et al., 2010). Within the territory of Serbia, 374 species

were found. The research on aphid fauna in Serbia was most contributed by Petrović (1998), Petrović-Obradović (2003), as well as Poljaković-Pajnik et al. (2002), Vučetić et al. (2014) and Petrović-Obradović et al. (2007, 2010, 2018).

The primary aim of this study was to explore the diversity of aphid fauna during the ten-year research period in the region of Southeastern Serbia. The secondary aim was to determine the number of trophic associations between aphid species and their host plants.

Materials and methods

This study was based on material collected during the last ten years in different types of habitats

© 2019 Ilić-Milošević et al. This is an open-access article distributed under the terms of the Creative Commons Attribution License, which permits unrestricted use, distribution, and build upon your work non-commercially under the same license as the original.

of Southeastern Serbia. Aphids were collected from plant parts by using a fine thin brush and were transferred to plastic tubes filled with 90% ethanol. The specimens were identified according to keys prepared by Blackman & Eastop (1994, 2000, 2006). All analyzed material has been deposited at the Faculty of Agriculture, University of Belgrade, Serbia. Plants were identified using Josifović, ed. (1970-1976) and deposited in the herbarium of the Faculty of Sciences and Mathematics, University of Niš, Serbia (HMN).

Results

Aphid-host plant associations

Species of Aphididae are listed alphabetically, with the following order: host plant, host plant family in parenthesis, collection site, date of collection and legator (VŽ-Vladimir Žikić, DV-Darija Veličković, SSS-Saša S. Stanković, MR-Milica Ristić, MIM-Marijana Ilić Milošević, MD-Maja Đorđević, ML-Maja Lazarević, NS-Nikola Stanković, AS-Aleksandra Stojiljković, MS-Milan Stanisljević, BZ-Bojan Zlatković, NM-Nikola Mladenović, MM-Majda Mehanović, DN-Danijela Nikolić, ZK-Zora-na Kojićić, LjM-Ljubomir Mihajlović).

Discussion

In this study we sampled 211 plant species, which were attacked by 118 aphid species within 46 genera and 9 subfamilies, formed 436 bi-trophic associations. Most of the aphid species were collected on plants from the family Asteraceae (105 associations) belonging to 27 genera, followed by the family Rosaceae (88 associations) from 11 genera. Among the aphid genera, *Aphis* Linnaeus was at the same time the most common (211 associations) and the most diverse aphid genus (34 species). Within this genus, species *A. fabae* Scopoli established the largest number of trophic associations (88), usually with plants from families Asteraceae and Rosaceae. *Aphis fabae* has an almost cosmopolitan distribution and represents one of the most important agricultural pests (Blackman & Eastop, 2000, Minks & Harrewijn, 1989). Also, *A. craccivora* Koch formed 27 associations. As well as *A. fabae*, *A. craccivora* is a polyphagous species. However it prefers plants from

family Fabaceae (Blackman & Eastop, 2007). After the genus *Aphis*, the next most diverse genera were *Brachycaudus* van der Goot (7 species), *Dysaphis* Börner (6 species) and *Uroleucon* Mordvilko (6 species). Within the genus *Brachycaudus*, the most frequently recorded species was *B. cardui*. This aphid altered the hosts between various fruit trees of genus *Prunus* L. and usually *Carduus* L. and *Cirsium* Mill. species (InfluentialPoints. 2018). Within the genera *Dysaphis* and *Uroleucon*, *D. plantaginea* (Linnaeus), *U. cichorii* (Passerini) and *U. jaceae* (Linnaeus) formed the largest number of associations. The primary hosts for *D. plantaginea* were species from genus *Malus* Mill (InfluentialPoints. 2018). In our study, we noticed that this aphid caused damage on species *M. pumila* Mill. Species *U. cichorii* Mordvilko was usually collected on *Crepis* L., while *U. jaceae* (Linnaeus) on *Carthamus* L. and *Centaurea* L. Species *Macrosiphum rosae* (Linnaeus) and *Myzus cerasi* (Fabricius) formed nine associations. All other recorded aphid species appeared in lower frequencies.

This research contributes to a better knowledge about diversity of aphids in the territory of Serbia.
